

The L S Theobald Lecture: Measuring airborne nanoparticles, and related topics

Richard Brown

**RSC-NPL Symposium: Nanoparticle concentration – critical
needs and state-of-the-art measurement**

24 April 2018

Overview

- What is air quality about?
- Why measure (nano)particles in air?
- How is it done?
- What does this tell us?
- How do we know we can trust the results?

Leslie Stuart Theobald (1898-1979)

- “...everyone was in awe of Theobald...on Fridays he made the students polish their benches.”
- “...as having been kind to his demonstrators, and taking them to watch Wimbledon tennis matches, and to dinner afterwards in Kensington...”
- “Theobald was remembered...as strict and rigorous...duplicates has to agree to 1 part in 500 for volumetric analysis and 1 part in 1000 for gravimetric analysis.”
- “...uncompromising in the quest for accuracy. Before one could start...**one had to calibrate the balance weights, the burette, the pipettes and calibrated flasks. These results would be checked against results obtained by previous students almost back to the dawn of time.**”

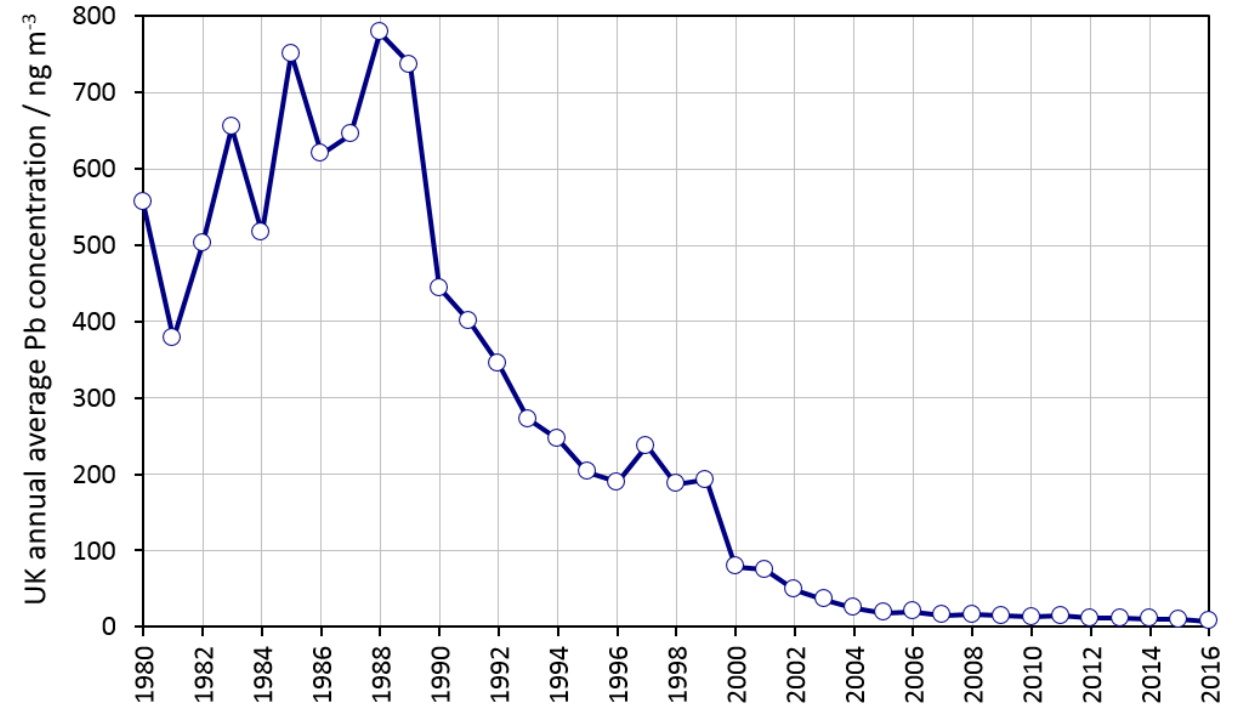

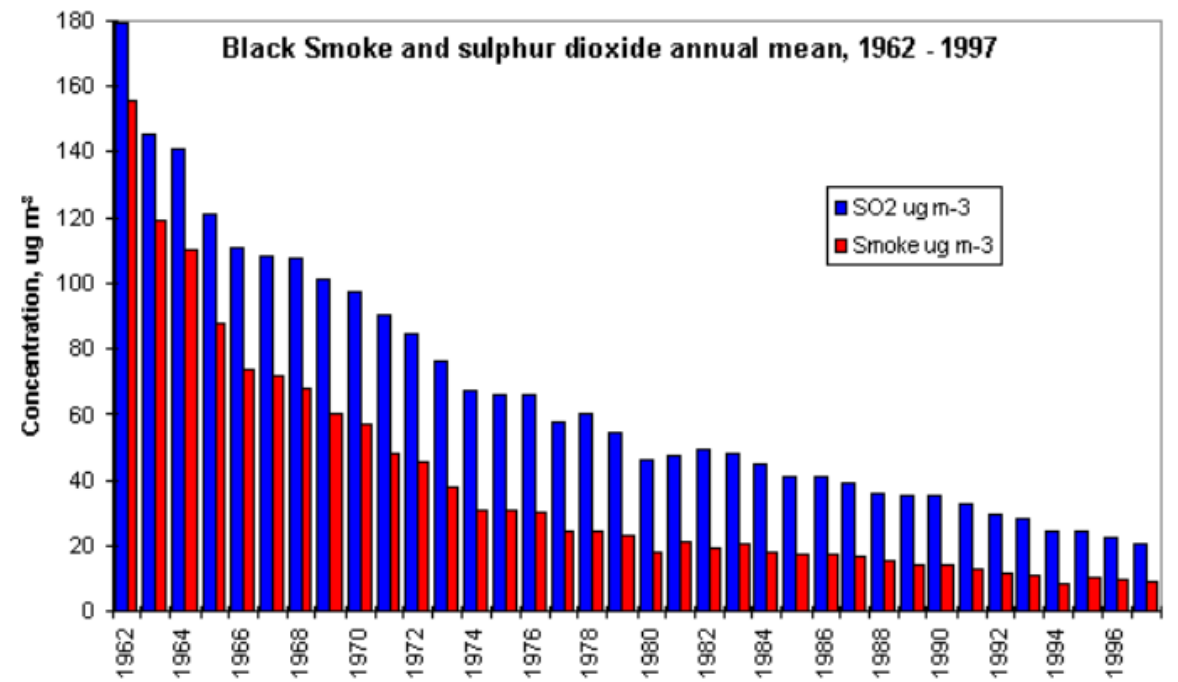

Air quality

- Great Smog of London

Air quality

- Pollution decreased
- Other threats also decreased

1940s–1950s

1960s–1980s

1980s–2000s

Across this period in time:

Clean Air Act 1956

Lead in fuel restricted 1998

Current focus on particles and NO₂

Greatest health effects & UK fails to meet EC limits

- In urban areas traffic emissions are clearly seen
- Industry nowadays not located in urban centres
- Industrial emissions well abated

Pollution breached EU limits at nearly 50 sites in London last year

Worst area for pollution in London revealed to be Brixton Road in Lambeth

Tolls on polluted roads – and ALL petrol and diesel vehicles banned from 2040

WAR ON DIESELS GETTING DIRTY

Ban from 2040 on diesel and petrol car sales

UK plans follow French commitment to take polluting vehicles off the road

Asmita Sarkar
Political editor

Britain will stop all new petrol and diesel cars and vans from 2040 as part of a government strategy to improve air quality and leave the young people of tomorrow with a cleaner and healthier planet.

The commitment, which follows similar pledges in France, is part of the government's overall strategy to cut air pollution, which has been the most significant health concern in the country.

The government is providing a public register to help local authorities and citizens understand the impact of air pollution in their areas, which will be updated by the end of 2017. This is a step towards the already committed government strategy to improve air quality and reduce air pollution.

It is also part of the government's overall strategy to cut air pollution, which has been the most significant health concern in the country.

Pollution is killing millions of people a year and the world is reaching 'crisis point', experts warn

The Government must act immediately to stop millions of people dying, say researchers

Air Pollution causes cancer, confirms WHO

BY MALIKA SUBRAMANIAN

Air pollution causes cancer, the World Health Organization (WHO) has confirmed. The WHO has said that outdoor air pollution is a carcinogen, and that it causes lung cancer, bladder cancer, and acute myeloid leukaemia.

The WHO's International Agency for Research on Cancer (IARC) has said that outdoor air pollution is a carcinogen, and that it causes lung cancer, bladder cancer, and acute myeloid leukaemia.

The WHO's International Agency for Research on Cancer (IARC) has said that outdoor air pollution is a carcinogen, and that it causes lung cancer, bladder cancer, and acute myeloid leukaemia.

Delhi has much to worry about

- ▶ Delhi's air quality improved from an AQI of 389 on Saturday to 329 on Sunday
- ▶ Air quality remains in the "very poor" category but has come out of the "severe" category recorded on Friday – a day after Diwali
- ▶ A rise in temperature and wind speed could be the reason, say experts. Air quality may improve further in the next 24 hours

LET DELHI BREATHE

| | Air Quality | AQI |
|--------------------|-------------|-----|
| Oct 22 (Sunday) | Very Poor | 329 |
| Oct 21 (Saturday) | Very Poor | 389 |
| Oct 20 (Friday) | Severe | 403 |
| Oct 19 (Thursday) | Very Poor | 319 |
| Oct 18 (Wednesday) | Very Poor | 302 |
| Oct 17 (Tuesday) | Very Poor | 306 |

EU urban population exposed to harmful levels of air pollution (2010-2012)

| | EU Limits/Target Values | WHO Guidelines |
|-------------------|---|--|
| PM _{2.5} | 9-14 %  | 87-93 %  |
| PM ₁₀ | 17-30 %  | 61-83 %  |
| O ₃ | 14-15 %  | 97-98 %  |
| NO ₂ | 8-12 %  | 8-12 %  |
| BaP | 25-28 %  | 85-91 %  |
| SO ₂ | < 1 %  | 36-37 %  |

- EU Limit values for many pollutant gases & also PM_{2.5} and PM₁₀
- Target values for the maximum composition of certain PM components
- Metals (Pb, Ni, As, Cd), PAHs (BaP)

National air quality objectives and European Directive limit and target values for the protection of human health

| Pollutant | Applies | Objective | Concentration measured as ¹⁰ | Date to be achieved by (and maintained thereafter) | European Obligations | Date to be achieved (by and maintained thereafter) |
|--|---|---|---|--|---|--|
| Particles (PM ₁₀) | UK | 50 µg/m ³ not to be exceeded more than 35 times a year | 24 hour mean | 31 December 2004 | 50 µg/m ³ not to be exceeded more than 35 times a year | 1 January 2005 |
| | UK | 40 µg/m ³ | annual mean | 31 December 2004 | 40 µg/m ³ | 1 January 2005 |
| | Indicative 2010 objectives for PM ₁₀ (from the 2000 strategy and Addendum) have been replaced by an exposure reduction approach for PM _{2.5} (except in Scotland – see below) | | | | | |
| | Scotland | 50 µg/m ³ not to be exceeded more than 7 times a year | 24 hour mean | 31 December 2010 | 50 µg/m ³ not to be exceeded more than 35 times a year | 1 January 2005 |
| | Scotland | 18 µg/m ³ | annual mean | 31 December 2010 | 40 µg/m ³ | 1 January 2005 |
| Particles (PM _{2.5}) Exposure Reduction | UK (except Scotland) | 25 µg/m ³ | annual mean | 2020 | Target value - 25 µg/m ³ | 2010 |
| | Scotland | 10 µg/m ³ | | 31 December 2020 | Limit value - 25 µg/m ³ | 1 January 2015 |
| | UK urban areas | Target of 15% reduction in concentrations at urban background | | Between 2010 and 2020 | Target of 20% reduction in concentrations at urban background. | Between 2010 and 2020 |

What's in Particulate Matter?

Outdoor pollution: vehicle exhaust, industrial emissions Indoor pollution: tobacco smoke, household fumes*

| Life Stage | Category | Harms from high pollution |
|--------------|-------------------|--|
| In the womb | Outdoor pollution | Smaller head, Lower birth weight at term |
| Baby/toddler | Outdoor pollution | Developmental problems, More wheezing, More coughs |
| Child | Outdoor pollution | Slower development of lung function, Asthma, Start of atherosclerosis |
| Adult | Indoor pollution | Accelerated decline in lung function, Asthma, Type 2 diabetes, Heart attacks, Start of lung cancer |
| Older person | Indoor pollution | Accelerated decline in lung function, Asthma, Type 2 diabetes, Poor cognition, Heart attacks, heart failure and strokes, Lung cancer |

*Includes exhaust gases from cooking, heating and burning solid fuels, use of household cleaners and other chemicals, VOCs, etc

Costs of air pollution

The annual mortality burden in the UK from exposure to outdoor air pollution is equivalent to around 40,000 deaths. To this can be added further impacts from exposure to indoor air pollutants such as radon and second-hand smoke.

PM_{2.5} and NO₂

Reality Check: Does pollution cut short 40,000 lives a year?

6 March 2017

Reality Check verdict: The 40,000 figure for the UK stems from extensive research over decades in the US. It's a statistical construct not a count of actual deaths. There is no question that air pollution, caused by many factors, is a serious health problem but it's difficult to assess its precise impact.

But the authors of this report stressed the uncertainty of their findings. In particular, COMEAP said when it used the 6% figure that it was 75% confident the actual figure was between 1% and 12%. That translates as meaning that that the number of early deaths, for which 29,000 was the central estimate, was probably between 5,000 and 60,000, but there was a one in four chance that it was even outside that range.

PM_{2.5} only

It is not possible to count the number of people who have died early as a result of pollution because nobody has air pollution written as the cause of death on their death certificates.

Overall

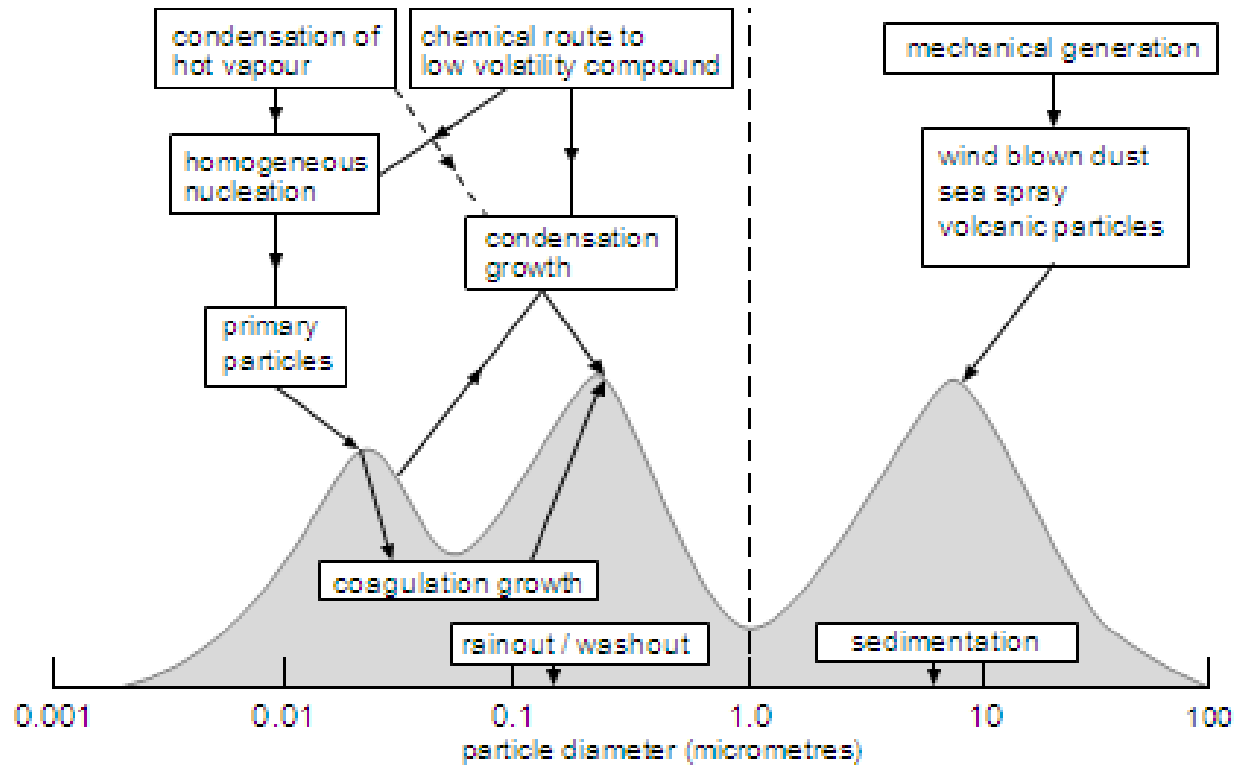

- The effects of air pollution are challenging to quantify
- Because of all the other confounding variables
- Because of the difficulty of measuring air quality accurately – in particular personal exposure
- Defining increased risk of death
- **We need better data (lower uncertainties) or better metrics**

www.rcplondon.ac.uk/projects/outputs/every-breath-we-take-lifelong-impact-air-pollution

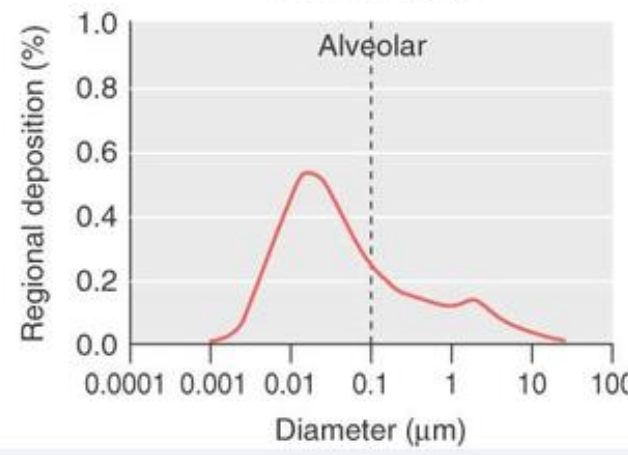

Fig 16. Meta-analysis of the association with age of increased risk of death from exposure to PM₁₀. Solid squares represent results from younger populations; open squares represent those for older populations.

Are there better metrics we can use?

An number distribution, surface distribution, and volume distribution functions plotted against $\log(D_p)$. (from Seinfeld and Pandis)

| Particle Diameter / nm | Relative Mass per Particle | Relative Surface Area per Mass | Relative Number per Mass | Respiratory Penetration |
|------------------------|----------------------------|--------------------------------|--------------------------|-------------------------|
| 10 000 | 8 000 000 | 1 | 1 | Nasal Passage |
| 2 500 | 125 000 | 4 | 64 | Trachea, Bronchi |
| 1 000 | 8 000 | 10 | 1 000 | Alveoli |
| 50 | 1 | 200 | 8 000 000 | Bloodstream |

- The smaller the particle the further into the lung they can penetrate
- This is generally more dangerous since the body cannot easily remove them
- Nanoparticles can enter the bloodstream

Better, more effective metrics?

- Particle number concentration may be a **better metric for health impacts**
- **More measurements required** to know whether this is the case
- **Not as simple or as well standardised** as particle mass measurement
- Not a current requirement of air quality legislation

Cardiovascular Mortality (lag 1)

(Graph shows % change between 25%ile and 75%ile concentration and 95% CI)

UK Particle Number and Size measurements

- Non-regulatory research network

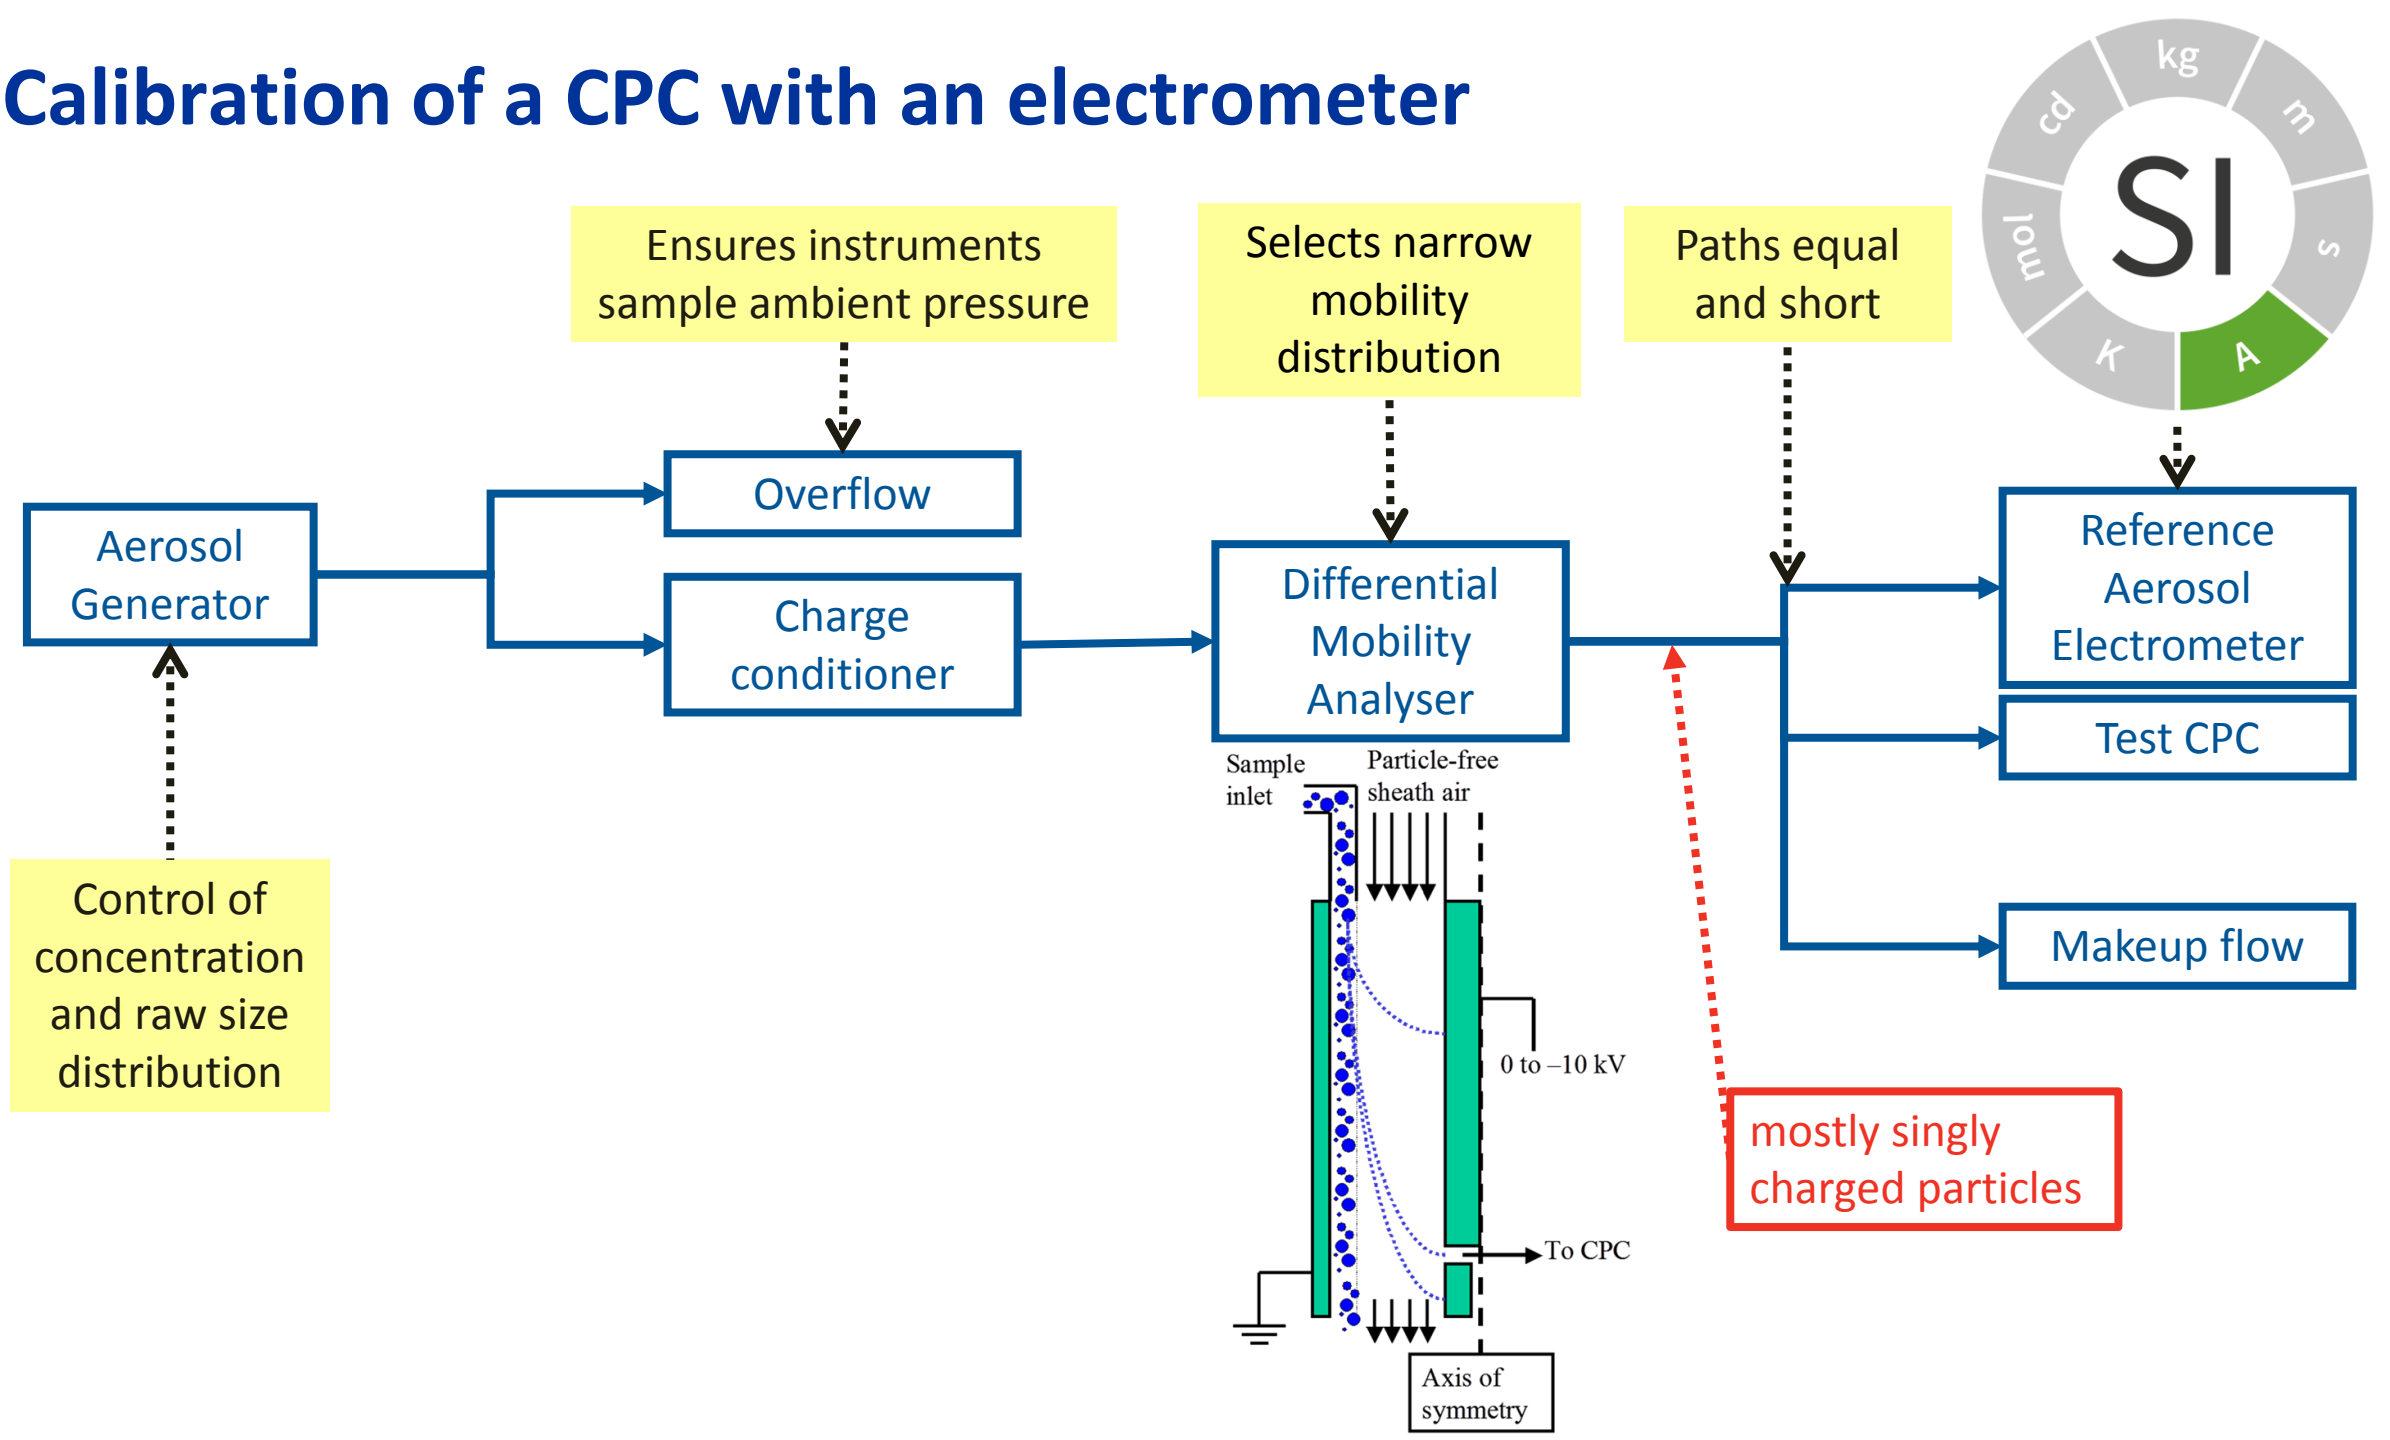

Differential Mobility Analyser

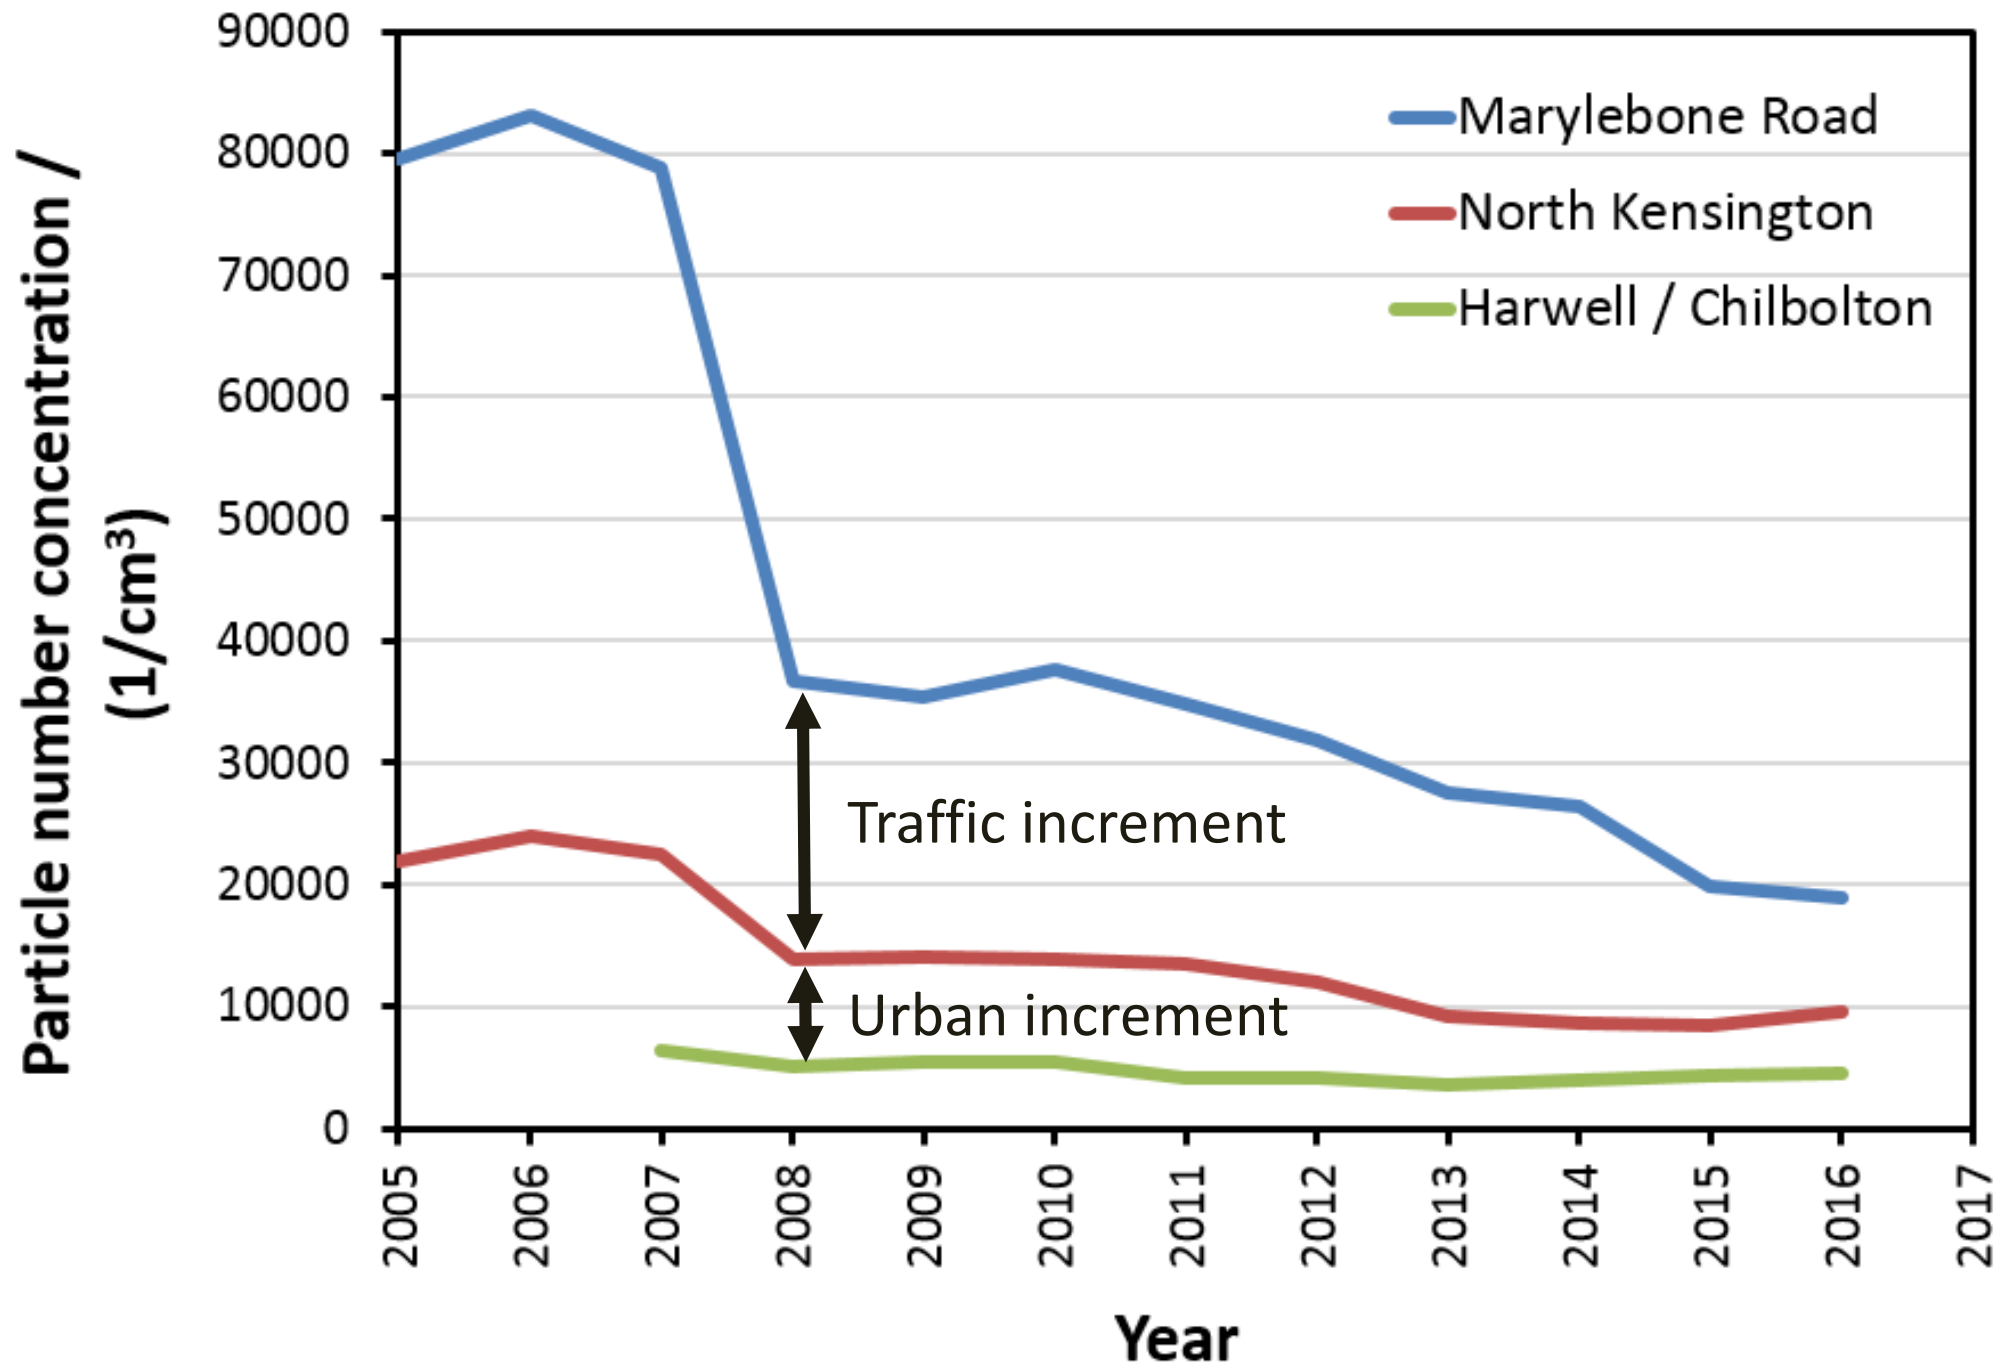

- Traceability to aerosol electrometer, calibrated using primary current standards

Calibration of a CPC with an electrometer

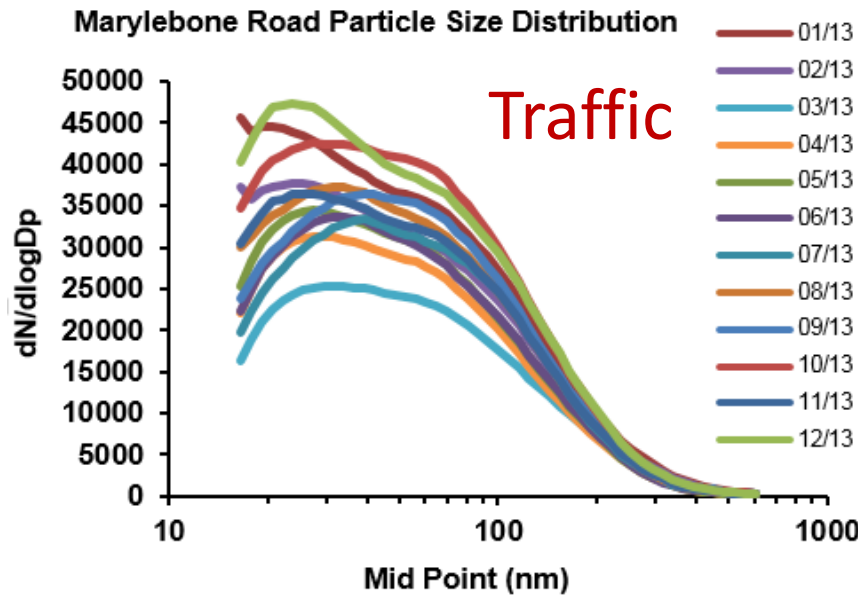

CPC results

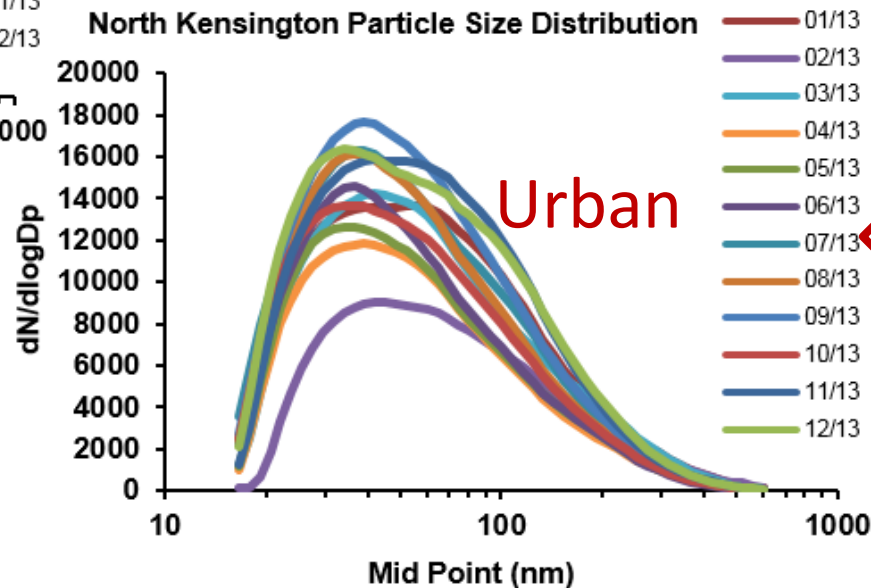

CPC results

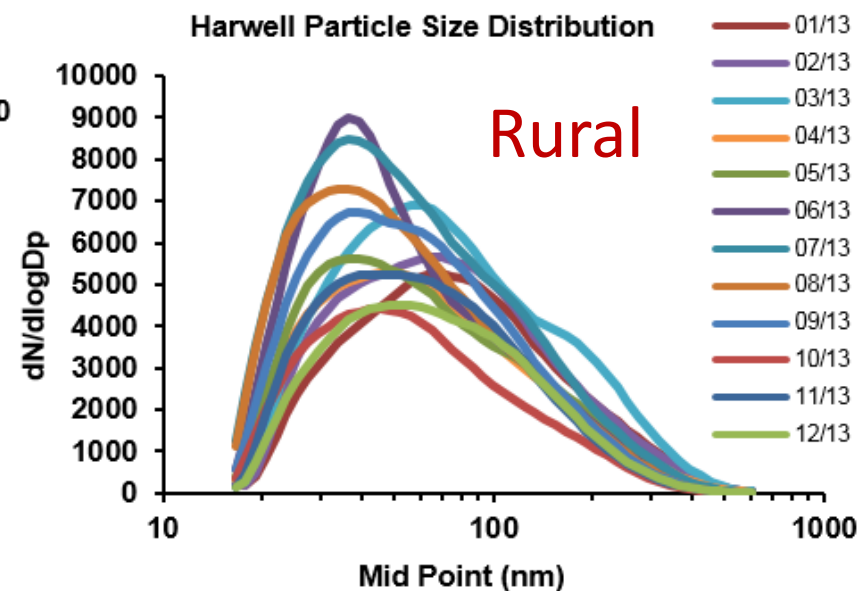

Dominated by primary emissions from vehicles

Mixed anthropogenic sources

SMPS results

Higher nucleation events in warmer, sunnier months

Why are these outputs useful

- This data supports **evidence-based** policy development, policy assessment, health studies and environmental research
- We are able to draw these conclusions because we have **confidence in the data** produced
- We have confidence in the data produced because we have an appropriate system of checks and controls in place to ensure the **quality of the results**
- We ensure the quality of results because we apply a rigorous **metrological approach**

→ What is metrology?

Metrology is the science of measurement,
embracing both experimental and theoretical determinations
at any level of uncertainty
in any field of science and technology.

Traceability, Uncertainty, Comparison: The three big topics of metrology

2.41 (6.10)

metrological traceability

property of a **measurement result** whereby the result can be related to a reference through a documented unbroken chain of **calibrations**, each contributing to the **measurement uncertainty**

2.26 (3.9)

measurement uncertainty

uncertainty of measurement
uncertainty

non-negative parameter characterizing the dispersion of the **quantity values** being attributed to a **measurand**, based on the information used

2.1 (2.1)

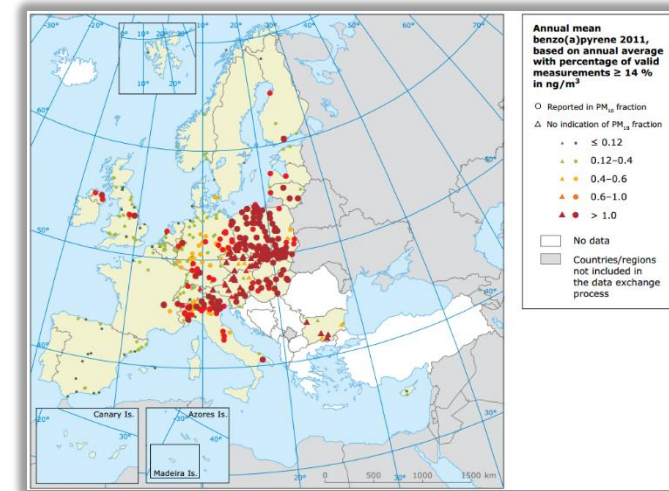

measurement

process of experimentally obtaining one or more **quantity values** that can reasonably be attributed to a **quantity**

NOTE 1 Measurement does not apply to **nominal properties**.

NOTE 2 Measurement implies comparison of quantities and includes counting of entities.

The outputs of metrology?

confidence in trends

confidence in spatial data

- Metrology provides a measurement infrastructure which is stable over time, comparable between locations, and coherent, allowing measurements of different properties using different methods to be combined (without scaling factors)

confidence that data can be used directly in the equations of science across disciplines

Counting (nano)particles

- Counting is a recognised measurement!
- The unit for counting quantities is one, symbol '1'
- There is only one unit for counting but an almost limitless number of quantities
- This means we need a very clear description of the measurand when expressing results
- We should also resist the temptation to mix the quantities and units

 ➤ In the air sampled the number concentration of particles with an aerodynamic diameter of between 10 nm and 1 µm was, $C = (1.00 \pm 0.05) \times 10^6 \text{ 1/m}^3$

 ➤ $C = (1.00 \pm 0.05) \times 10^6 \text{ particles}_{(10 \text{ nm} - 1 \text{ }\mu\text{m})}/\text{m}^3$

Good Practice Guide No. 11

2001 The Beginner's Guide to Uncertainty of Measurement

1.2 What is not a measurement?

There are some processes that might seem to be measurements, but are not. For example, comparing two pieces of string to see which is longer is not really a measurement. Counting is not normally viewed as a measurement. Often, a test is not a measurement: tests normally lead to a 'yes/no' answer or a 'pass/fail' result. (However, measurements may be part of the process leading up to a test result.)

Operationally defined measurands

3.7

ISO 17034:2006

operationally defined measurand

measurand that is defined by reference to a documented and widely accepted measurement procedure to which only results obtained by the same procedure can be compared

Note 1 to entry: Examples include crude fibre in foods, impact toughness, enzyme activities and extractable lead in soils.

- It is important to be very clear about what is being measured
 - Particles of a given size range, how is the size defined, of what composition?
- And to agree on the method being used to make the measurement (if this matters)
- To some extent all measurands are method defined – just a question of whether **within-laboratory variability** or **between-laboratory variability** dominates
- CEN/TS 16976:2016: Ambient air. Determination of the particle number concentration of atmospheric aerosol

An example – Particle size distribution

Diameters:
1, 2 & 3
units

$$X_{nl} = D[1,0] = \frac{1+2+3}{3} = \underline{2.00}$$

$$X_{ns} = D[2,0] = \sqrt{\frac{1+4+9}{3}} = \underline{2.16}$$

$$X_{nv} = D[3,0] = \sqrt[3]{\frac{1+8+27}{3}} = \underline{2.29}$$

$$X_{ls} = D[2,1] = \frac{1+4+9}{1+2+3} = \underline{2.33}$$

$$X_{lv} = D[3,1] = \sqrt{\frac{1+8+27}{1+2+3}} = \underline{2.45}$$

$$X_{sv} = D[3,2] = \frac{1+8+27}{1+4+9} = \underline{2.57}$$

$$X_{vm} = D[4,3] = \frac{1+16+81}{1+8+27} = \underline{2.72}$$

Electron microscopy

Image analysis

Electrozone sensing

- Crucial to define the measurand & method
- This may depend on the application

Surface area moment mean

Laser diffraction

Ensuring measurement quality

1. Measurements should be fit for purpose
2. Use properly validated methods and equipment
3. Staff should be suitably qualified to perform the measurements
4. Regular independent assessment of performance
5. Well defined quality control & quality assurance procedures
6. Measurements should be stable over time and comparable across location

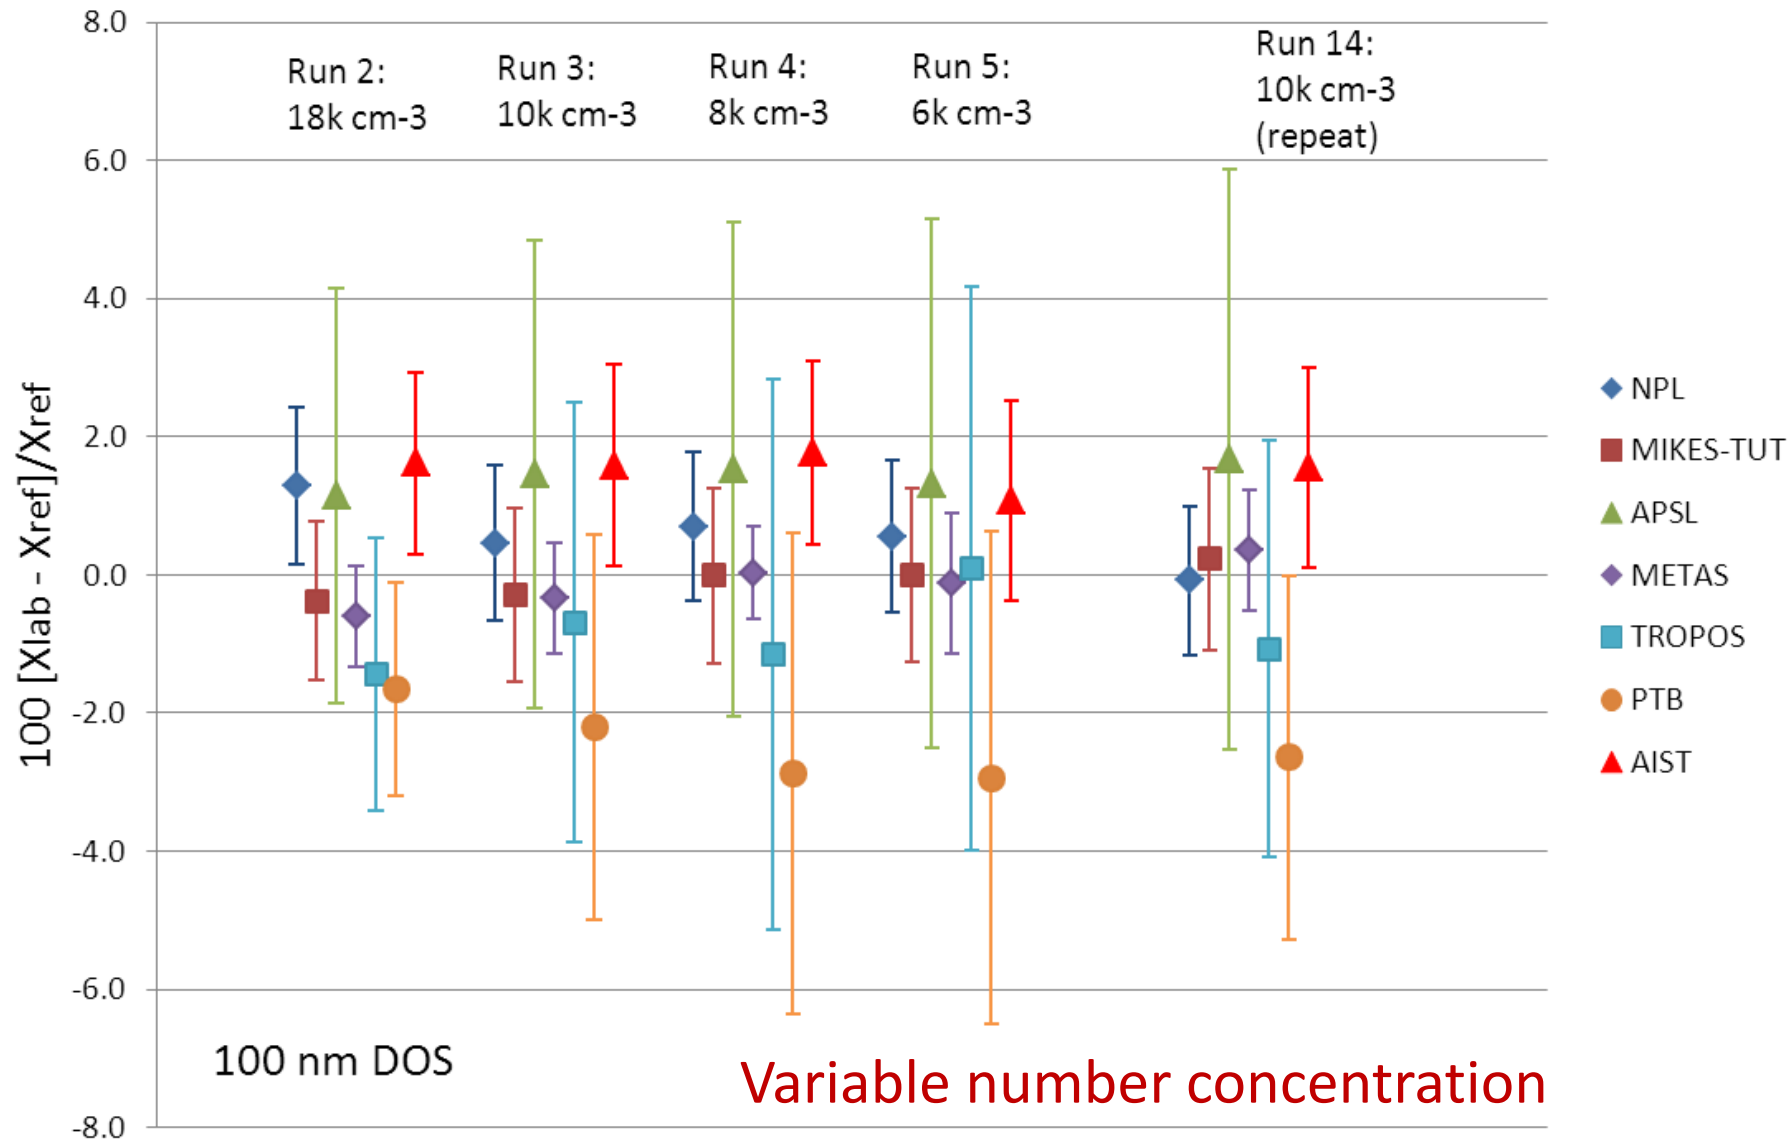

Ensuring Quality: Comparisons / Proficiency Testing

- An excellent way of demonstrating on-going competence
- Comparison of methods and measurands
- Improving performance
- Determining method precision and accuracy
- Comparing operator capabilities
- Instilling confidence in staff, management and customers
- Satisfying regulators and accreditation bodies

Comparisons at the National Metrology Institute level

- EURAMET 1244 aerosol electrometer
- Comparison of primary standards
- Indication of how well these units can be realised
- Provides traceability for all measurements of nanoparticles in air and emissions
- **State-of-the-art is $\pm 2\%$**

Comparisons at the National Metrology Institute level

- EURAMET 1244 aerosol electrometer
- Comparison of primary standards
- Indication of how well these units can be realised
- Provides traceability for all measurements of nanoparticles in air and emissions
- **State-of-the-art is ± 2 %**

Coherent

- Special property of SI units
- Allows use across disciplines without scaling
- Requires full measurement understanding

Comparable

- Allows comparison across locations
- Requires agreement on methods & measurands
- Requires external comparison

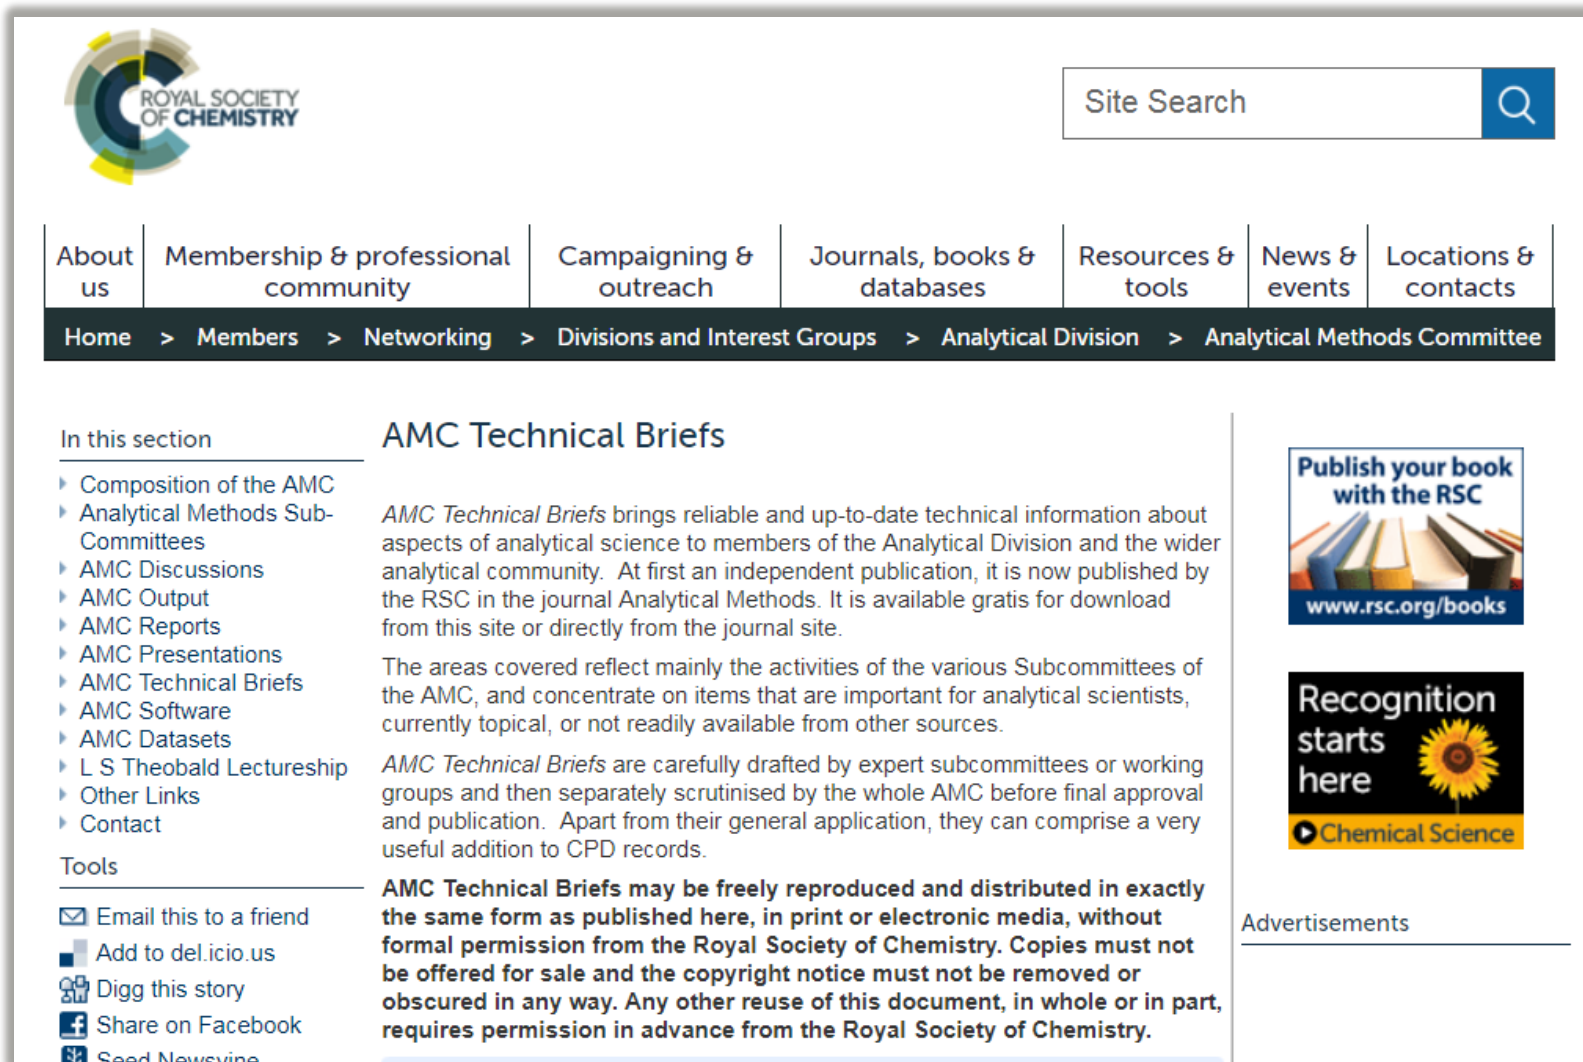

Stable

- Essential property of measurement locally
- Allows comparison over time
- Requires validated methods & ongoing QA/QC

↑ Measurement uncertainty ↑

RSC's Analytical Methods Committee

www.rsc.org/Membership/Networking/InterestGroups/Analytical/AMC/TechnicalBriefs.asp

The screenshot shows the RSC website interface. At the top left is the RSC logo. To its right is a search bar labeled 'Site Search'. Below these are navigation tabs: 'About us', 'Membership & professional community', 'Campaigning & outreach', 'Journals, books & databases', 'Resources & tools', 'News & events', and 'Locations & contacts'. A breadcrumb trail below the tabs reads: 'Home > Members > Networking > Divisions and Interest Groups > Analytical Division > Analytical Methods Committee'. The main content area is titled 'AMC Technical Briefs'. On the left, there is a sidebar with 'In this section' containing a list of links: 'Composition of the AMC', 'Analytical Methods Sub-Committees', 'AMC Discussions', 'AMC Output', 'AMC Reports', 'AMC Presentations', 'AMC Technical Briefs', 'AMC Software', 'AMC Datasets', 'L S Theobald Lectureship', 'Other Links', and 'Contact'. Below this is a 'Tools' section with social media sharing options: 'Email this to a friend', 'Add to del.icio.us', 'Digg this story', 'Share on Facebook', and 'Send Newsvine'. The main text describes the briefs as reliable, up-to-date technical information available for free download. It lists the areas covered and states that the briefs are carefully drafted and scrutinized. A copyright notice at the bottom of the main text states that the briefs may be freely reproduced in the same form as published, without formal permission, provided the copyright notice is not removed or obscured. On the right side of the page, there are two advertisements: 'Publish your book with the RSC' with the URL 'www.rsc.org/books', and 'Recognition starts here' with the 'Chemical Science' logo.
