Meter EMI - A test bed based on the IEC61000-4-19 immunity apparatus

Jonathan Braun, Karel Pitaš

Split signal test bed principle

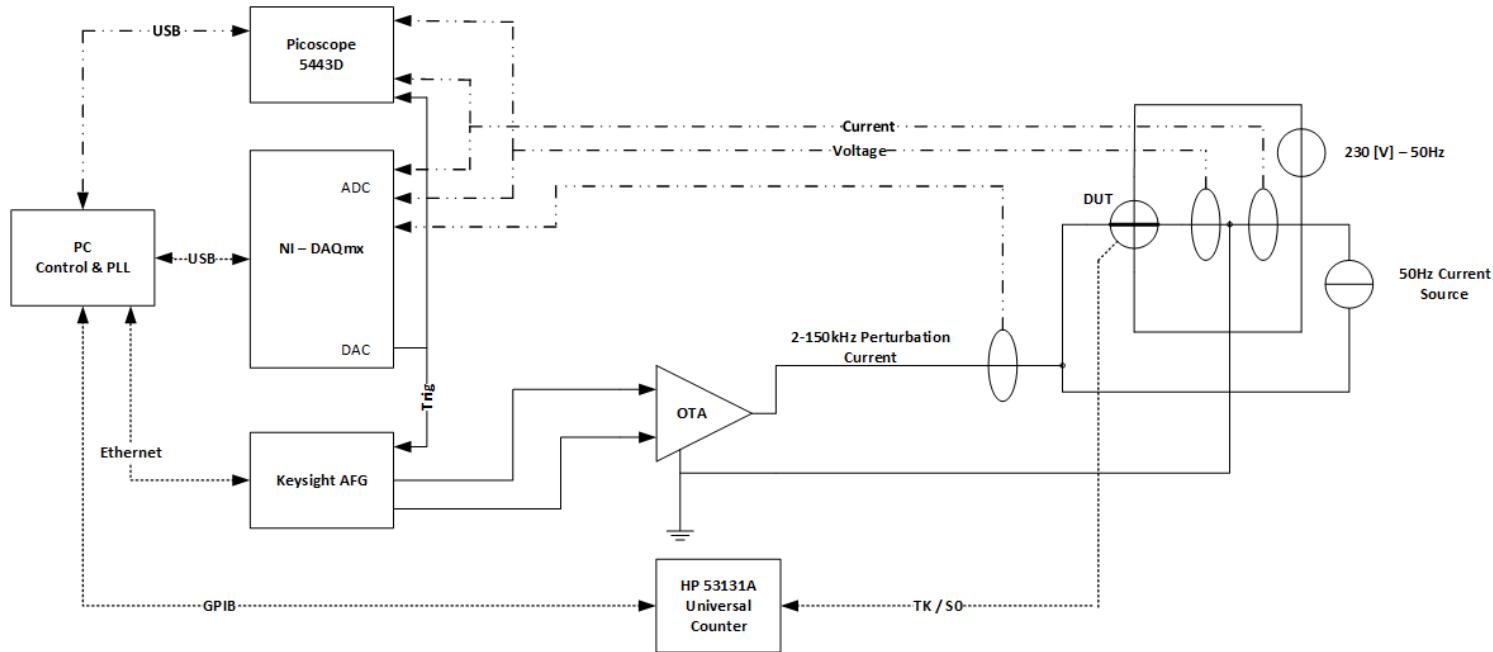

- Existing IEC 61000-4-19 setup at METAS

- 2 sinewave sources: 50 Hz and HF perturbations
- Up to 10 A perturbations
- Error measurement with MT3000 system
- Only sinewave, no synchronisation

Split signal test bed principle

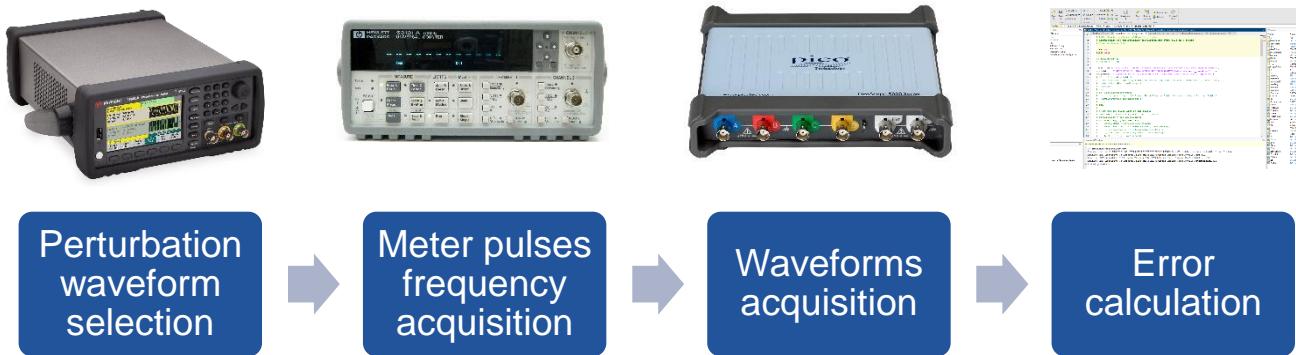

- Adapted arbitrary waveform setup

- 50Hz source + arbitrary source
- Up to 100 A perturbations
- Perturbation synchronized to the 50 Hz source
- Voltage and current reacquisition for error calculation

Split signal test bed principle

- Methodology

- Sources

METAS AGM 77 – 50 Hz
Voltage & Current Source

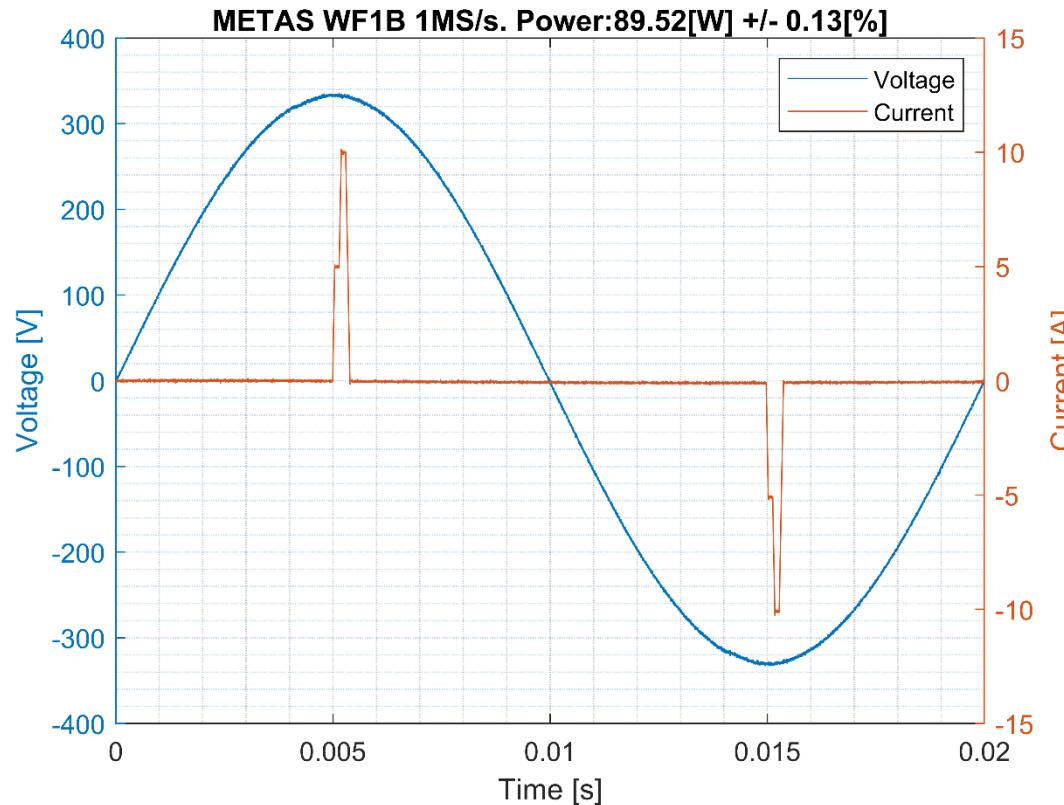

Clarke-Hess 8100
Transconductance amplifier
current perturbation source

Split signal test bed principle

- Current system limitations
 - Limited to current perturbations
 - Precise reproducibility of arbitrary waveforms is limited by the trigger system
- Current system advantages:
 - Relatively easy to adapt from an IEC 61000-4-19 setup
 - Perturbation can be superposed to a sinewave if higher currents are needed

Split signal test bed results

- Typical recorded waveform (WF1B)
 - Current probe: Pearson 110A
 - Voltage probe: Pico TA043

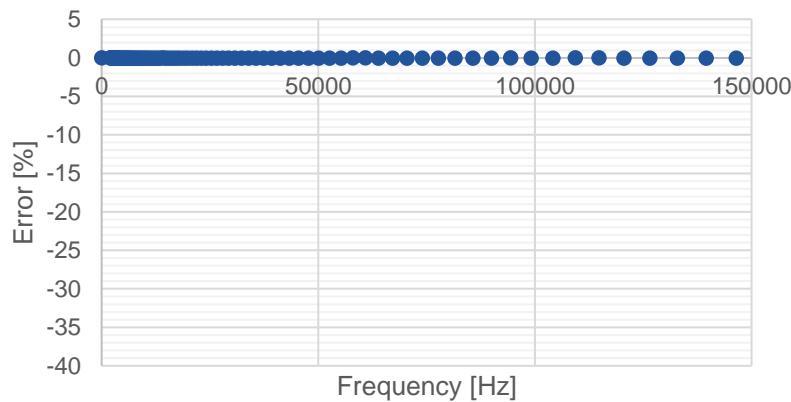

Split signal test bed results

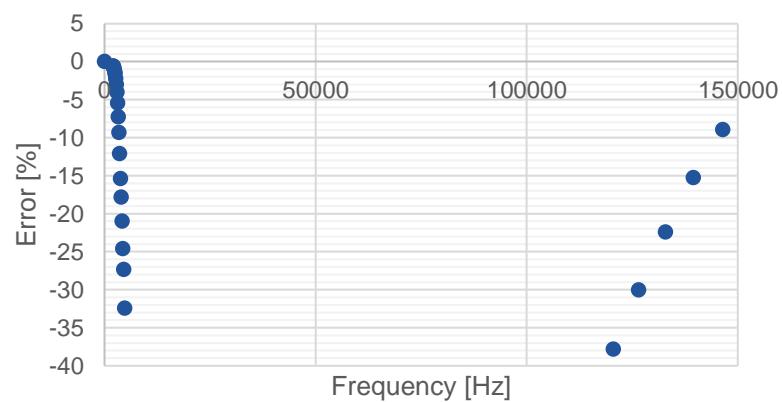

- Meter A and B were tested with the same methodology

Meter A 2-150 kHz results

Meter B 2-150 kHz results

Split signal test bed uncertainty

- Uncertainties sources in the METAS split signal test bed are the following:
 - Pearson 110A current probe
 - Relative uncertainty on amplitude: $\pm 1 [\%]$
 - Pico TA043 voltage probe
 - Relative uncertainty on amplitude: $\pm 2 [\%]$
 - HP 5131A frequency counter
 - Relative uncertainty on frequency: $\sim \pm 10^{-9} [\%]$ → **Neglected**
 - Picoscope 5443
 - Relative uncertainty on amplitude: $\pm 0.5 [\%]$

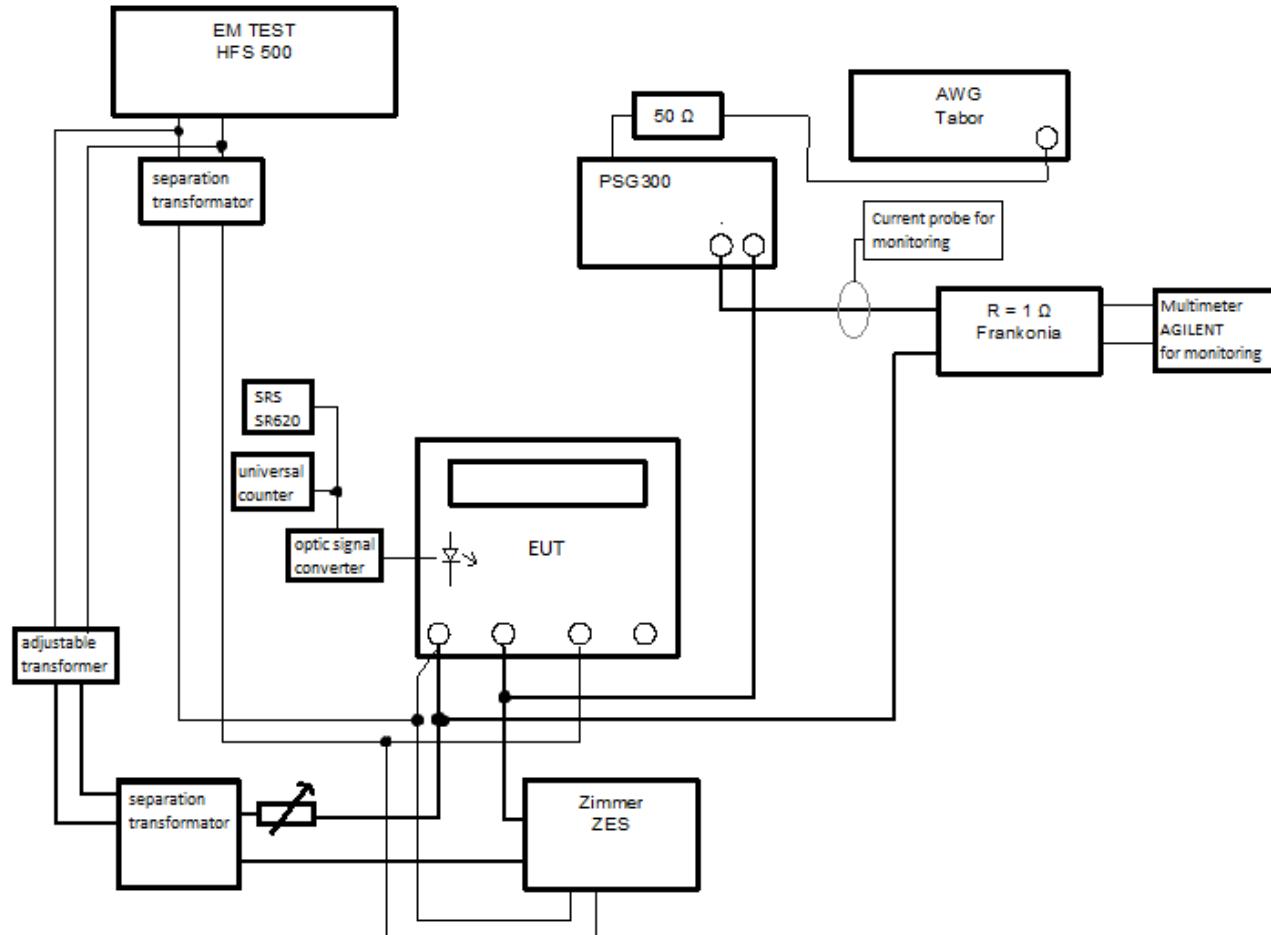

Calculated relative uncertainty on waveform power:

max $\pm 1 [\%]$

typ $\pm 0.2 [\%]$

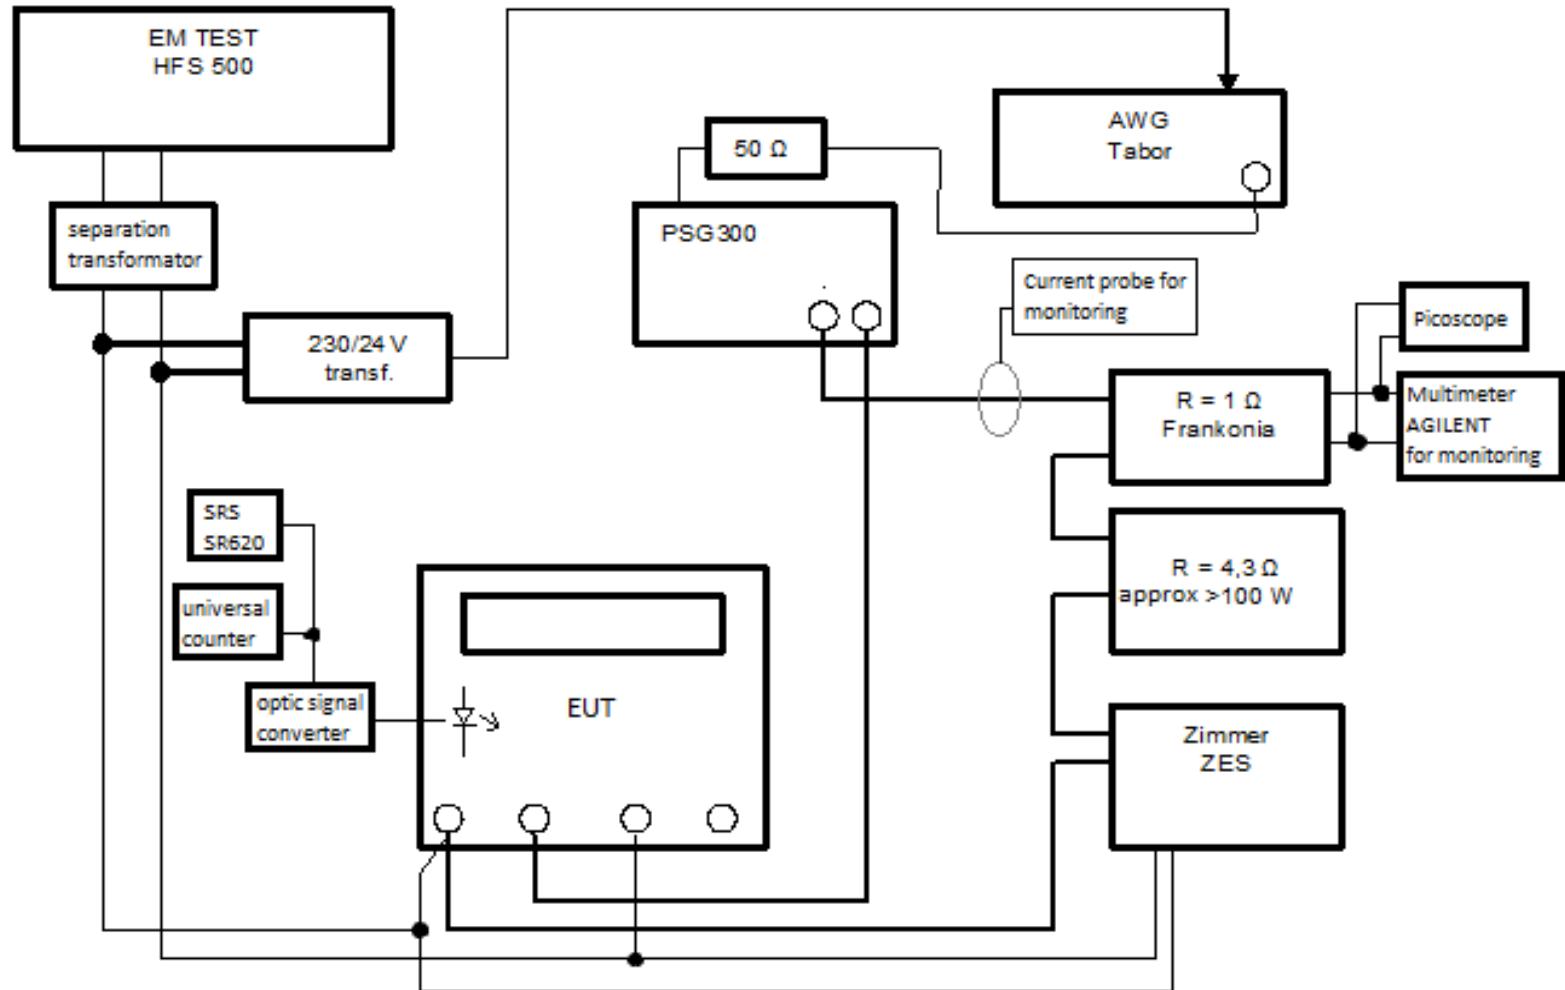

Split signal test bed principle

- Existing IEC 61000-4-19 setup at CMI

Split signal test bed principle

- Adapted arbitrary waveform setup

Split signal test bed principle

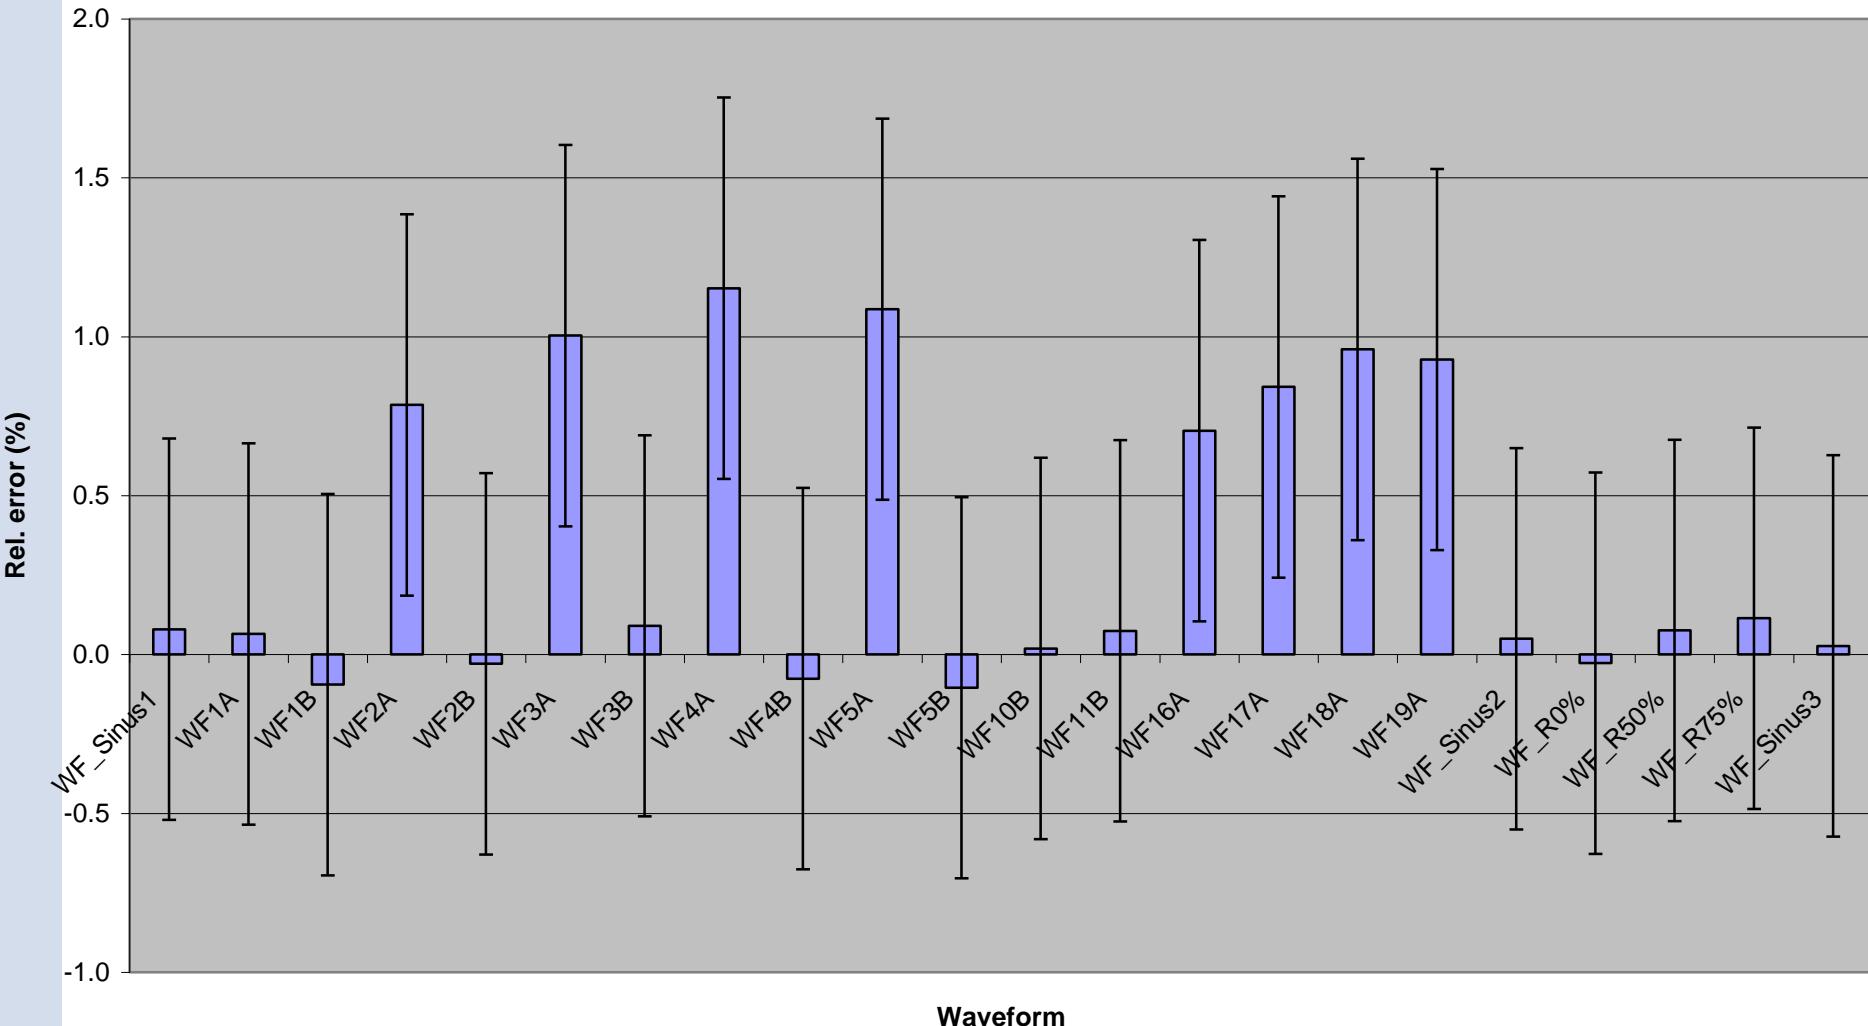

- Current system limitations
 - Current generator limitation
 - Precise reproducibility of arbitrary waveforms is limited by the AWG Tabor and by Picoscope
- Current system advantages:
 - Easy to adapt from an IEC 61000-4-19 setup

Split signal test bed results

	Average relative power error (%)			Mean value
Waveform	Meas. 1	Meas. 2	Meas. 3	(%)
WF_Sinus1	-0.17	0.29	0.12	0.08

Split signal test bed results

Relative error

Split signal test bed uncertainty

Uncertainties sources in the CMI split signal test beds are the following.

- Setting interference:
 - Triggering of AWG Tabor
 - Frankonia 1ohm shunt
 - Picoscope
- Measuring:
 - ZES Zimmer LMG450 (best accuracy 0,11%)
 - Optic converter
 - SRS SR620 (best accuracy 0.3 %)
